EXPRESS MAIL CERTIFICATE

Date

1 hereby certify that, on the date indicated above, this paper or fee was deposited with the U.S. Postal Service & that it was PCT/IB00/00011 addressed for delivery to the Assistant Commissioner for Patents, Washington, DC 20231 by "Express Mail Pest Times to Addressee" service.

USE OF PHANQUINONE FOR THE TREATMENT OR PREVENTION OF MEMORY IMPAIRMENT.

#### 5 FIELD OF THE INVENTION

The present invention relates to the treatment or prevention of memory impairment and to a method of improving the learning and memory capabilities of normal subjects. Notably, the invention relates to the use of phanquinone for the prevention or treatment of memory impairment and to a method comprising the administering of phanquinone for improving the learning and the memory capabilities of a normal subject.

#### 15 DESCRIPTION OF THE BACKGROUND ART

Memory is a complex mental function which includes the ability to learn, retain, and recall information. Memory impairment is often a symptom of dementia, amnesia, aphasia, senility, or age-associated cognitive deterioration. Dementia may be caused by i.a. Alzheimer's disease, Parkinson's disease, progressive supranuclear palsy, and amyotrophic lateral sclerosis.

Two types of memory are generally recognized, viz. short-term and long-term memory. The short-term memory is the ability to learn and briefly retain small amounts of information for a few seconds or minutes and to recall the information again. The long-term memory is the ability to learn and retain large amounts of information and recall those after long delays. Impairment of both types of memory may be symptoms of dementia.

The short-term memory is impaired for persons suffering from dementia in the early stages. Such persons have difficulty in learning new information and 35 to retain it more than momentarily. As the disease

progresses, new learning is severely curtailed and, gradually, the long-term memory is also lost.

Several compounds or mixtures of compounds have been suggested in the prior art for the treatment of 5 mental decline.

Pyrrolidone or pyrrolidine derivatives for improving memory have been suggested in EP 239500, EP 165919, BE 892942, US 5102882, EP 296978, EP 296979. Pyridine derivatives for the treatment of impairment of short-10 term memory are disclosed in US 4448779. Choline derivatives for treating mental decline in the elderly is suggested in EP 201623. Indole or indolin derivatives for the improvement of processes involved in learning are disclosed in EP 241006, JP 6107544, US 15 5494928, WO 97/47598, and US 4778812. Pilocardin derivatives for improving memory functions are disclosed in US 4977176. Glycine-containing compositions for enhancing cognitive functions are disclosed in US Peptide derivatives for treating mental 20 decline and improving mental capacity are disclosed in US 5439930, RU 2099078, and WO 95/15310. Xanthine derivatives for the treatment of age-related memory impairment are disclosed in WO 94/19349.

Compounds enhancing the stimulus-induced release
25 of neurotransmitters, especially acetylcholine, may
also be used to treat memory impairment. Examples are
2-benzyl-2-propyl 2-amino-2-R-acetate derivatives disclosed in EP 293351, 1-(4-chlorophenyl)-2-methyl-2propyl 2-amino-3-methyl-butanoate disclosed in GB
30 2205097, polycyclic hetero-aromatic derivatives disclosed in US 5300642, 5-phenyl-4,4-dimethyl-3-oxo or
hydroxy-pentylamine derivatives disclosed in EP 322391,
1-oxa-8-azaspiro(4.5)decane derivatives disclosed in EP
491562, derivatives of azacyclic and azabicyclic
35 hydroxylamine disclosed in WO 94/00448, halogenated

aromatic derivatives disclosed in EP 627400, derivatives of acyclic and cyclic amides disclosed in WO 95/29909, carbamoyloxypropylamine or carbamoyloxyethylamine derivatives disclosed in WO 96/08468.

Compounds that modulate the function of the kainate receptor may be used for improving memory. An example is alkyl carboxy amino acids, such as (2S,4R)-4-methyl glutamic acid, disclosed in WO 96/25387.

In EP 326381 it is suggested to use hypothalamic 10 hypophysiotropic hormones, such as somatostatin and growth-hormone releasing factor, to improve the learning abilities.

DE 2555010 discloses the use of uronic acids for improving the cerebral efficiency in general, such as improvement of memory.

US 4481206 discloses the improvement of memory when administering spiro(N'-methyl-4'-piperidyl)-N-ethyl-succinimide. This compound is a parasympathico-mimetic substance also having cholinomimetic, analgetic and sedative activity.

WO 98/33498 discloses the use of breflate or analogous compounds thereof for the treatment of a mammal suffering from a cognitive dysfunction. Breflate or analogous compounds thereof enhance the long-term 25 potential of nerve cells.

Phanquinone (4,7-phenanthroline-5,6-dione) has hitherto been used for the treatment of various disorders, such as amoebiasis. However, the treatment or prevention of memory impairment has not been suggested previously. Phanquinone has been marketed by CIBA-GEIGY as ENTOBEX®.

It is the object of the invention to provide a new use of a known pharmaceutical compound for the treatment or prevention of memory impairment. Another object of the invention is to provide a method of treating a

WO 00/40244 PCT/IB00/00011

4

subject suffering from or suspected of suffering frommemory impairment. A further object of the invention is to provide a method for improving the learning and memory ability of a normal subject.

5

#### DISCLOSURE OF THE INVENTION

According to the present invention the use of phanquinone for the manufacture of a pharmaceutical composition for the treatment or prevention of memory 10 impairment is provided.

Phanquinone may be administered in any amount efficient for the treatment or prevention of memory impairment. Preferably, phanquinone is administered in an amount of 5 mg to 250 mg, and most preferred 10 mg to 50 mg, one to three times daily. The pharmaceutical composition may be formulated for oral, parenteral or intradermal administration.

According to the present invention also a method for improving the learning or memory of a normal subject is provided, said method comprising the administering of phanquinone, optionally together with one or more pharmaceutically acceptable carrier(s). Phanquinone may be administered in any amount effective to improve the learning or the memory.

The invention also relates to a method of treating a subject suffering from or suspected of suffering from memory impairment, said method comprising administering to the subject an amount of phanquinone effective to treat or prevent the memory impairment.

According to the present invention also a method of treating a subject suffering from or suspected of suffering from memory impairment is provided, said method comprising administering to the subject an amount of phanquinone effective to improve learning or 35 memory.

Phanqionone possesses a long-term as well as a short-term effect on the memory.

The short-term effect implies that the ability to retain and recall information from the memory is improved compared to the normal state, when phanquinone is administered immediately prior to a trial.

The long-term effect implies that the memory improving effect of phanquinone still is obtained several days after the administration has ceased.

The exact function of phanquinone in the body is not known yet. However, as the effect of phanquinone is pronounced in all parts of memory formation, including learning, retaining and recalling information, the effect of phanqionone is considered to be unspecific.

15 Most likely, the effect of phanquinone is referred to enhanced arousal. This hypothesis is supported by the fact, that a general enhancement of activity is observed.

The above attempt to explain the observed effects 20 of phanquinone is without prejudice to the scope of protection sought and must not be construed as limiting the invention to a specific mode of action.

#### DETAILED DESCRIPTION OF THE INVENTION.

Phanquinone is preferably administered together with one or more pharmaceutical acceptable carrier(s). The carrier(s) must be "acceptable" in the sense of being compatible with the other ingredients of the composition and not deleterious to the recipients thereof. In a preferred embodiment, the phanquinone and optional further active constituents in a pharmaceutical composition are purified.

It will be appreciated that the amount of phanquinone and optional further active constituents required for said treatment, improvement or prevention

will vary according to the route of administration, the disorder to be treated, the condition, age, the case history of the subject, the galenic formulation of the pharmaceutical composition, etc.

In general, a suitable therapeutically effective amount of phanquinone in the pharmaceutical composition would be e.g. 5 to 250 mg, preferably 10 to 50 mg.

The actually administered amounts of phanquinone and optional further active constituents may be decided 10 by a supervising physician. If the pharmaceutical composition in addition to phanquinone comprises further active constituents those may be included therein for administering in combination concurrently, or in different compositions for administering substantially simultaneously but separately, or sequentially.

Therapeutic formulations include formulations suitable for parenteral (including intramuscular and intravenous), oral, rectal or intradermal administration, although oral administration is the preferred route. Thus, the pharmaceutical composition may be formulated as tablets, pills, syrups, capsules, suppositories, formulations for transdermal application, powders, especially lyophilized powders for reconstitution with a carrier for intravenous administration, etc.

The term "carrier" refers to a diluent, adjuvant, excipient, or vehicle with which phanquinone is administered. The carriers in the pharmaceutical composition may comprise a binder, such as microcrystalline cellulose, polyvinylpyrrolidone (polyvidone or povidone), gum tragacanth, gelatine, starch, lactose or lactose monohydrate; a disintegrating agent, such as alginic acid, maize starch and the like; a lubricant or surfactant, such as magnesium stearate, or sodium lauryl sulphate; a glidant, such as colloidal silicon

dioxide; a sweetening agent, such as sucrose or sactharin; and/or a flavouring agent, such as peppermint, methyl salicylate, or orange flavouring.

Therapeutic formulations suitable for oral administration, e.g. tablets and pills, may be obtained by
compression or moulding, optionally with one or more
accessory ingredients. Compressed tablets may be
prepared by mixing the constituent(s), and compressing
this mixture in a suitable apparatus into tablets
having a suitable size. Prior to the mixing, the
phanquinone may be mixed with a binder, a lubricant, an
inert diluent and/or a disintegrating agent and further
optionally present constituents may be mixed with a
diluent, a lubricant and/or a surfactant.

15 In a preferred embodiment, free-flowing phanquinone powder is mixed with a binder, such as microcrystalline cellulose, and a surfactant, such as sodium lauryl sulphate, until a homogeneous mixture is obtained. Subsequently, another binder, such as 20 polyvidone, is transferred to the mixture under stirring. Said mixture is passed through granulating sieves and dried by desiccation before compression into tablets in a standard compressing apparatus.

In a second preferred embodiment, free-flowing phanquinone powder is mixed with surfactants and/or emulsifying agents, such as Sapamine® (N-(4'-stearoyl amino phenyl)-trimethylammonium methyl sulphuric acid) and lactose monohydrate until a uniform distribution of the constituents is obtained. A second preparation containing a disintegrating agent, such as maize starch, is added to the phanquinone mixture under continuous stirring. Such a second preparation may be obtained by adding excess boiling water to maize starch suspended in cold water. The final mixture is granu-

and magnesium stearate and finally compressed intotablets in a standard apparatus.

A tablet may be coated or uncoated. An uncoated tablet may be scored. A coated tablet may be coated 5 with sugar, shellac, film or other enteric coating agents.

Therapeutical formulations suitable for parenteral administration include sterile solutions or suspensions of the active constituents. An aqueous or oily carrier 10 may be used. Such pharmaceutical carriers may be sterile liquids, such as water and oils, including petroleum, animal, vegetable or synthetic origin, such as peanut oil, soy bean oil, mineral oil, sesame oil and the like. Formulations for parenteral administration also include a lyophilized powder comprising phanquinone and optionally further active constituents that is to be reconstituted by dissolving in a pharmaceutically acceptable carrier dissolving the active constituents, e.g. an aqueous solution of carboxymethylcellulose and lauryl sulphate.

When the pharmaceutical composition is a capsule, it may contain a liquid carrier, such as a fatty oil, e.g. cacao butter.

Suitable pharmaceutical excipients include starch,
25 glucose, lactose, sucrose, gelatine, malt, rice, flour,
chalk, silica gel, sodium stearate, glycerol monostearate, talc, sodium chloride, dried skim-milk, glycerol,
propylene, glycol, water, ethanol and the like. Said
compositions may form solutions, suspensions, emul30 sions, tablets, pills, capsules, powders, sustainedrelease formulations and the like. The composition can
be formulated as a suppository, with traditional
binders and carriers such as triglycerides.

In one embodiment of the pharmaceutical composi-35 tion according to the invention, phanquinone and the WO 00/40244 PCT/IB00/00011

9

possible further active constituents, are comprised asseparate pharmaceutical entities. The two entities may be administered simultaneously or sequentially.

Other features and advantages of the invention 5 will be apparent for the skilled person.

#### EXAMPLE 1

# <u>Preparation of a pharmaceutical composition comprising</u> phanquinone

10 250 g of phanquinone was mixed with 200 g sapamine® (N-(4'-stearoyl amino-phenyl)-trimethylammonium methyl sulphuric acid) and 1025 g lactose mono-hydrate for a period of 5 minutes. 300 g of boiling water was added at a time to a mixture of 100 g maize starch in 15 100 g cold water. The maize suspension, cooled to 40°C, was added to the phaniquinone-containing powder mixture under continuous stirring. The mixture was granulated using a 2.5 mm sieve and desiccated for 18 hours at 40°C. The dry granules were mixed with 400 g maize 20 starch and 20 g magnesium stearate. The final mixture was formulated into tablets having a diameter of 8.0 mm and a weight of 200 mg.

VIII - W

#### What Is Claimed

5

15

- 1. A method for improving the learning or memory of a normal subject, comprising administering phanquinone to the subject, optionally together with one or more pharmaceutically acceptable carriers.
- 2. A method of treating a subject suffering from or suspected of suffering from memory impairment, comprising administering to the subject an amount of phanquinone effective to treat or prevent the memory impairment.
- 3. A method of treating a subject suffering from or suspected of suffering from memory impairment, comprising administering to the subject an amount of phanquinone effective to improve learning or memory.
  - 4. A method according to any of claims 1 to 3, wherein the amount of phanquinone is 5 mg to 250 mg.
    - 5. A method according to claims 1 to 3, wherein the amount of phanquinone is 10 mg to 50 mg.
    - 6. A method according to any of claims 1 to 3, wherein the subject is human.
- 7. A method according to any of claims 1 to 3, wherein phanquinone is administered for up to ten years.
  - 8. A method according to any of claims 1 to 3, wherein phanquinone is administered orally.
- A method according to any of claims 1 to 3, wherein
   phanquinone is administered parenterally.

10. A method according to any of claims 1 to 3, wherein phanquinone is administered intradermally.

#### Abstract

The use of phanquinone (4,7-phenanthroline-5,6-dione) for the treatment or prevention of memory impairment is suggested.

Also a method for improving the learning or memory of a normal subject is suggested, said method comprising the administering of phanquinone, optionally together with one or more pharmaceutically acceptable carrier(s).
